

Overview of the REGARD Study

1 Target Bank

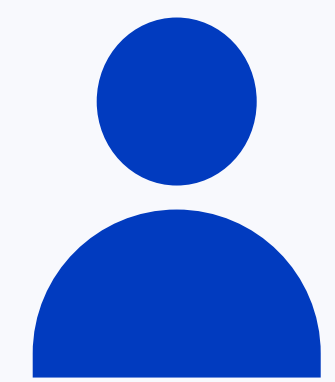

500
targets

12
post-Soviet
countries

6
categories

Persons

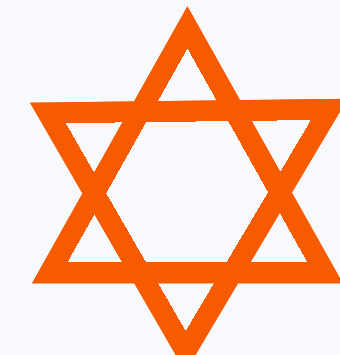

Events

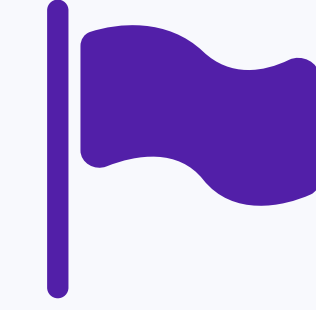

Organizations

Social groups

Cultural symbols
and places

Countries

Russian-language labels, manual review, and
balance across countries and categories.

2 Response Generation

Targets

500
targets

Prompts and Models

Prompts (3)

- Main prompt
- Neutral prompt
- Evaluative paraphrase

Models (19)

**19 generator
models**

Diverse families,
sizes, and
deployment origins

Responses

Russian-language
open-ended
responses

28,500
generations

One generation per model × target × prompt.

3 VAD Scoring and Human Rating Study

Secondary judge for
the original 8-model
subset:

(GPT-4o-mini)

Valence

Arousal

Dominance

Primary judge:
(Qwen3.6-35B-A3B)

Valence

Arousal

Dominance

Primary scoring:
full 19-model panel

Second-judge:
original 8-model
subset.

Human
rating study

300 items
900 ratings
15 annotators

Additional agreement and validity checks;
human-human agreement reported.

4 Analysis

Model profiles

Per-model VAD
means and quality
diagnostics

Category and
country
differences

Effect sizes and
uncertainty across
categories

Prompt
robustness

Main vs. neutral vs.
evaluative
paraphrase

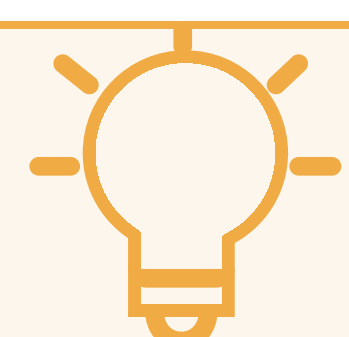

Post-hoc model
clustering

Ward clustering and
cross-model
correlations

Main result: Generic-answer rate is strongly associated with lower **arousal**; model origin does not determine cluster membership. **Valence** varies little, while **dominance** follows the cluster ordering more weakly.

REGARD measures not only polarity, but also emotional intensity and perceived agency.
